*Association between genetic risk (PRS) and age-specific risk of mental disorders*, Master Thesis in Bioinformatics © June 2024

We found evidence of polygenic risk scores (PRS) being associated with the diagnosis of mental health disorders, with variations in the effect of PRS based on age of onset and gender. We analyzed major depressive disorder (MDD), bipolar disorder (BIP), schizophrenia spectrum (SCZ), autism spectrum disorder (ASD), and attention-deficit/hyperactivity disorder (ADHD) in the iPSYCH cohort. Our results indicate that genetic risk is highest during late adolescence and early adulthood for MDD, SCZ, and BIP, peaking near the median age of onset for these disorders. Sex differences were evident, with males generally showing higher hazard ratios (HR) than females, even in disorders more prevalent in females, such as MDD; and especially relevant in schizophrenia where the estimates are 4 times higher for males. For ASD, PRS associations were strongest in early-diagnosed cases and exhibited significant gender differences, with females potentially requiring a higher genetic liability threshold for diagnosis. ADHD's high heritability is acknowledged, but the evolving diagnostic criteria limit conclusions on temporal trends in genetic influences.

PRS	Polygenic Risk Score
GWAS	Genome-Wide Association Studies
MDD	Major Depressive Disorders
SCZ	Schizophrenia
BIP	Bipolar Disorders
ADHD	Attention-Deficit/Hyperactivity Disorder
ASD	Autism Spectrum Disorders
AAO	Age At Onset
QC	Quality Control
PS	Population Structure
DST	Danmarks Statistik
SNP	Single Nucleotide Polymorphisms
MAF	Minor Allele Frequency
IPW	Inverse probability weighting
FPE	Female protective effect

## CONTENTS

---

Preface	11
1 INTRODUCTION	13
1.1 Genetics in psychiatric disorders	14
1.2 Aim of this project	16
1.3 What are Polygenic Risk Scores?	16
1.4 Polygenic Risk Scores in Epidemiologic studies	17
1.5 Register Based Research	18
1.5.1 Register Based Research in Denmark	18
1.6 Survival Analysis	19
2 METHODS	25
2.1 Study population	25
2.1.1 Danish Psychiatric Central Research Register	26
2.1.2 iPSYCH project	26
2.2 Polygenic Risk Scores obtention	28
2.3 Data processing	28
2.4 Survival analysis	29
2.5 Last remarks	30
3 RESULTS	31
3.1 Mood disorders and Schizophrenia	32
3.1.1 Sample characteristics	32
3.1.2 Polygenic Liability	32
3.1.3 Hazards of MDD, SCZ and BIP	34
3.2 Childhood disorders	39
3.2.1 Sample characteristics	39
3.2.2 Polygenic liability	40
3.2.3 Hazards of ADHD and ASD	40
4 DISCUSSION	45
4.1 Genetic risk over AAO	45
4.2 Associations with PRS for other mental disorders at age of onset	47
4.3 Sex differences	47
5 CONCLUSION	51
5.1 Evidence on relevance of genetic association over AAO	51
5.2 The default male; or how diagnosis is biased	51
5.3 Use of PRS in clinical settings; fair use of PRS	52
5.4 Limitations	53
A SUPPLEMENTARY MATERIALS	55
A.1 HR tables	55
A.2 Lexis Diagrams	58
A.3 Comorbidity and PRS correlation	60
REFERENCES	61
