

Hidden Markov Models

Selecting the initial model parameters

Using HMMs for (simple) gene finding

Christian Nørgaard Storm Pedersen

cstorm@birc.au.dk

Last time

Training, or how to select model parameters (transition and emission probabilities) to reflect either a set of corresponding (\mathbf{X}, \mathbf{Z}) 's (Training by Counting), or just a set of \mathbf{X} 's (Viterbi Training, and EM Training).

HMMs as a generative model

A HMM *generates a sequence of observables* by moving from hidden state to hidden state according to the transition probabilities and *emitting an observable* (from a discrete set of observables, i.e. a finite alphabet) from each hidden state visited *according to the emission probabilities* of the state ...

Model M :

A run follows a sequence of states:

$H \quad H \quad L \quad L \quad H$

And emits a sequence of symbols:

For a HMM that generates finite strings (e.g. a HMM with an end-state), the language $L = \{\mathbf{X} \mid p(\mathbf{X}) > 0\}$ is regular ...

Selecting initial model parameters

The initial selection of transition and emission probabilities, i.e. A , π , Φ , models (how we see) the underlying structure of the observations, i.e. the syntax of possible sequences of observations, recall that the language $L = \{x \mid P(x \mid \theta) > 0\}$ is regular.

The initial selection of parameters is essential just to decide which parameters are 0 (or 1), i.e. to decide which transitions or emissions should never (or always) be possible ...

Example – Gene finding

Each protein is encoded in a stretch of DNA. A **gene** ...

Which is **expressed** when the protein is needed ...

Important problem

Locating genes on the genome and determining how they get expressed ...

Recognizing the patterns that indicates a gene ...

Gene structure

Depends on the organism (eucaryote or procaryote)

(A) EUCARYOTES

(B) PROCARYOTES

Smaller genomes and high coding density.

Large genomes. Intron/exon structure and low coding density

Gene structure in eukaryotes

Eukaryotic gene structure in more details

Gene structure in procaryotes

Biological facts

- The gene is a substring of the DNA sequence of A,C,G,T's

Z: NNNCCCCCCCCNNNNNNNNCCCCCCCCCCCCCCCCNNNNNNNNNN

X: acgatgcgctaataatgtccgatgacgtgagcataagcgacatgcag

Gene structure in procaryotes

Biological facts

- The gene is a substring of the DNA sequence of A,C,G,T's
- The gene starts with a start-codon **atg**

Example – Gene finding

N: non-coding

$$\pi_N = 1$$

$$\pi_C = 0$$

C: coding

Example – Gene finding

N: non-coding

Gene finding

- Select initial model structure (e.g. as done here)
- Select model parameters by training. Either “by counting” from examples of (\mathbf{X}, \mathbf{Z}) 's, i.e. genes with known structure, or by EM- or Viterbi-training from examples of \mathbf{X} , i.e. sequences which are known to contain a gene.
- Given a new sequence \mathbf{X} , predict its gene structure using the Viterbi algorithm for finding the most likely sequence of underlying latent states, i.e. its gene structure

$$\pi_N = 1$$

$$\pi_C = 0$$

C: coding

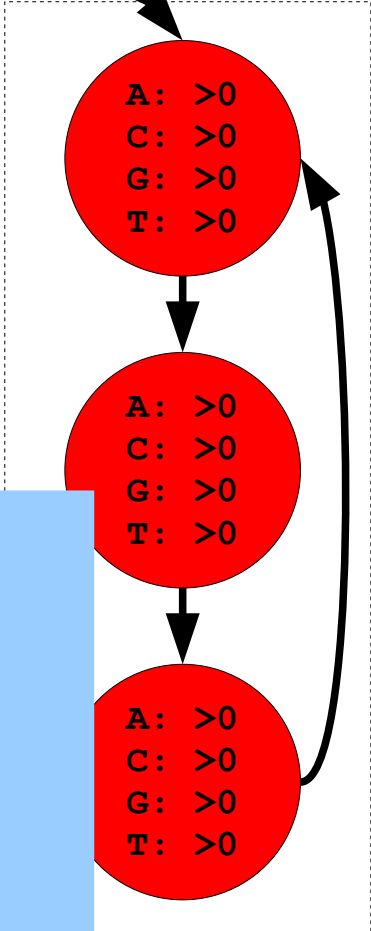

Example – Gene finding

N: non-coding

Gene finding

- Select initial model structure (e.g. as done here)
- Select model parameters by training. Either “by counting” from examples of (\mathbf{X}, \mathbf{Z}) 's, i.e. genes with known structure, or by EM- or Viterbi-training from examples of \mathbf{X} , i.e. sequences which are known to contain a gene.

Even more biology

- There can be genes in both directions (and over lapping)

- There are more possible start-codons **atg**, **gtg**, and **ttg**
- Internal codons cannot be stop-codons
- And a lot more ...

$$\pi_N = 1$$

$$\pi_C = 0$$

```

Summary

- We have considered the problem of selecting initial model parameters, and exemplified this problem by designing different HMMs for gene finding.
- Next time: See various extensions to the 'standard' HMM, which might be useful in some applications of HMMs, e.g. for gene finding.
