ML E2022 / CNSP 1/39

Hidden Markov Models

Terminology, Representation and Basic Problems

Christian Nørgaard Storm Pedersen

cstorm@birc.au.dk

ML E2022 / CNSP 2/39

The next two weeks

Hidden Markov models (HMMs):

Tue 1/11: Terminology and basic algorithms.

Fri 4/11: Implementing the basic algorithms.

Tue 8/11: Implementing the basic algorithms, cont.

Selecting model parameters and training.

Fri 11/11: Selecting model parameters and training, cont.

Extensions and applications.

Tue 15/11: Talk about mandatory project (hand in 3).

We use Chapter 13 from Bishop's book "Pattern Recognition and Machine Learning". Rabiner's paper "A Tutorial on Hidden Markov Models [...]" might also be useful to read.

BrightSpace and http://birc.au.dk/~cstorm/courses/ML_e22

ML E2022 / CNSP 3/39

What is machine learning?

Machine learning means different things to different people, and there is no general agreed upon core set of algorithms that must be learned.

For me, the core of machine learning is:

Building a mathematical model that captures some desired structure of the phenomenon/system that you are studying and you have data from.

<u>Training the model</u> (i.e. set the parameters of the model) based on existing data and knowledge to make it represent the system you are studying as good as possible.

<u>Making predictions</u> of the behavior of the system you are studying by using the trained model and new data, or study the trained model to learn about the system it is based upon

ML E2022 / CNSP 4/39

Data - Observations

A sequence of observations from a finite and discrete set, e.g. measurements of weather patterns, daily values of stocks, the composition of DNA or proteins, or ...

$$\mathbf{X} = \mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_N$$

Typical question/problem: How likely is a given **X**, i.e. p(**X**)?

We need a model that describes how to compute p(X)

ML E2022 / CNSP 5/39

Simple Models (1)

Observations are independent and identically distributed

$$\mathbf{x}_1$$
 \mathbf{x}_2 \mathbf{x}_3 \mathbf{x}_4 \cdots

$$p(\mathbf{x}_1, \dots, \mathbf{x}_N) = \prod_{n=1}^N p(\mathbf{x}_n)$$

Too simplistic for realistic modelling of many phenomena

ML E2022 / CNSP 6/39

Simple Models (2)

The *n*'th observation in a chain of observations is influenced only by the *n*-1'th observation, i.e.

$$p(\mathbf{x}_n|\mathbf{x}_1,\ldots,\mathbf{x}_{n-1})=p(\mathbf{x}_n|\mathbf{x}_{n-1})$$

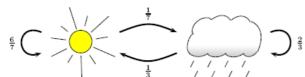

The chain of observations is a 1st-order Markov chain, and the probability of a sequence of *N* observations is

$$p(\mathbf{x}_1,\ldots,\mathbf{x}_N) = \prod_{n=1}^N p(\mathbf{x}_n|\mathbf{x}_1,\ldots,\mathbf{x}_{n-1}) = p(\mathbf{x}_1) \prod_{n=2}^N p(\mathbf{x}_n|\mathbf{x}_{n-1})$$

The model, i.e. $p(\mathbf{x}_n \mid \mathbf{x}_{n-1})$:

A sequence of observations:

by

the *n*-1'th observation, i.e.

$$p(\mathbf{x}_n|\mathbf{x}_1,\ldots,\mathbf{x}_{n-1})=p(\mathbf{x}_n|\mathbf{x}_{n-1})$$

The chain of observations is a 1st-order Markov chain, and the probability of a sequence of N observations is

$$p(\mathbf{x}_1,\ldots,\mathbf{x}_N) = \prod_{n=1}^N p(\mathbf{x}_n|\mathbf{x}_1,\ldots,\mathbf{x}_{n-1}) = p(\mathbf{x}_1) \prod_{n=2}^N p(\mathbf{x}_n|\mathbf{x}_{n-1})$$

ML E2022 / CNSP 8/39

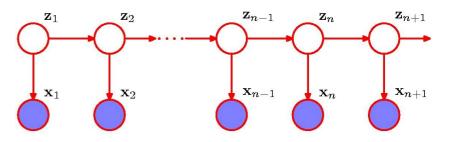

Hidden Markov Models

What if the *n*'th observation in a chain of observations is influenced by a corresponding hidden value/state?

Latent values

Observations

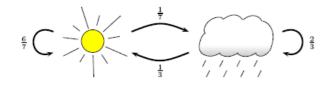

ML E2022 / CNSP 9/39

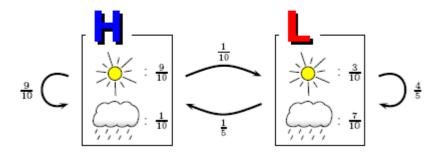

Hidden Markov Models

Transition probabilities

Notation: In Bishop, the hidden states \mathbf{z}_n are positional vectors, e.g. if $\mathbf{z}_n = (0,0,1)$ then the model in step n is in state k=3

Transition probabilities: If the hidden states are discrete with K states, the conditional distribution $p(\mathbf{z}_n \mid \mathbf{z}_{n-1})$ is a $K \times K$ table \mathbf{A} , and the marginal distribution $p(\mathbf{z}_1)$ describing the initial state is a K vector $\mathbf{\pi}$

The probability of going from state *j* to state *k* is:

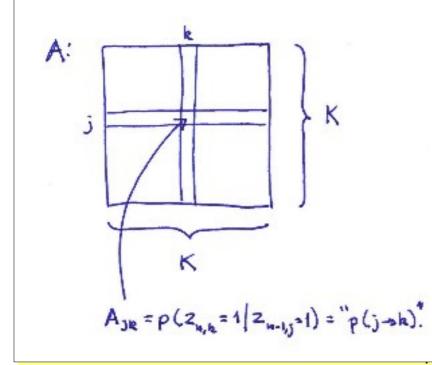

$$A_{jk} \equiv p(z_{nk} = 1 | z_{n-1,j} = 1)$$

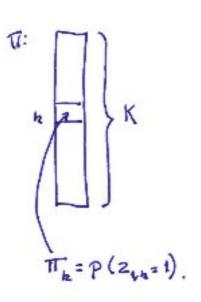

$$\sum_{k} A_{jk} = 1$$

$$\pi_k \equiv p(z_{1k} = 1)$$

$$\sum_{k} \pi_k = 1$$

ML E2022 / CNSP

ities

ositional vectors, e.g. k=3

re discrete with *K* and ial state is a *K*

vector π

The probability of going from state *j* to state *k* is:

$$A_{jk} \equiv p(z_{nk} = 1 | z_{n-1,j} = 1)$$
$$\sum A_{jk} = 1$$

$$\pi_k \equiv p(z_{1k} = 1)$$
$$\sum_k \pi_k = 1$$

The transition probabilities:

Notat

if $\mathbf{z}_n =$

Trans states the m

vecto

$$p(\mathbf{z}_n|\mathbf{z}_{n-1},\mathbf{A}) = \prod_{k=1}^K \prod_{j=1}^K A_{jk}^{z_{n-1,j}z_{nk}}$$

$$p(\mathbf{z}_1|\pi) = \prod_{k=1}^K \pi_k^{z_{1k}}$$

s, e.g.

K and

The probability of going from state *j* to state *k* is:

$$A_{jk} \equiv p(z_{nk} = 1 | z_{n-1,j} = 1)$$

$$\sum_{k} A_{jk} = 1$$

$$\pi_k \equiv p(z_{1k} = 1)$$

$$\sum_{k} \pi_k = 1$$

The transition prob $z_{n-1,j^*} = 1$ and $z_{n,k^*} = 1$,

This double product is $A_{j^*k^*}$ iff $z_{i,j} = 1$ and $z_{i,j} = 1$.

because $A_{jk}^{1} = A_{jk}$ and $A_{jk}^{0} = 1$

Notat

$$p(\mathbf{z}_n|\mathbf{z}_{n-1},\mathbf{A}) = \prod_{k=1}^K \prod_{j=1}^K A_{jk}^{z_{n-1,j}z_{nk}}$$

$$p(\mathbf{z}_1|\pi) = \prod_{k=1}^K \pi_k^{z_{1k}}$$

This product is similarly π_{k^*} iff $z_{1,k^*} = 1$

The probability of going from state *j* to state *k* is:

$$A_{jk} \equiv p(z_{nk} = 1 | z_{n-1,j} = 1)$$

$$\sum_{k} A_{jk} = 1$$

$$\pi_k \equiv p(z_{1k} = 1)$$

$$\sum_{k} \pi_k = 1$$

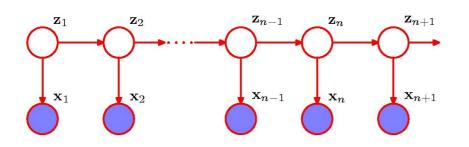

ML E2022 / CNSP 16/39

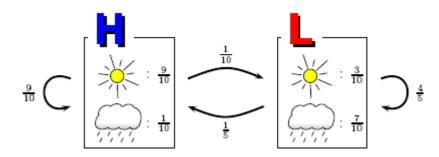

Emission probabilities

Emission probabilities: The conditional distributions of the observed variables $p(\mathbf{x}_n \mid \mathbf{z}_n)$ from a specific state

If the observed values \mathbf{x}_n are discrete (e.g. D symbols), the emission probabilities $\boldsymbol{\phi}$ is a KxD table of probabilities which for each of the K states specifies the probability of emitting each observable ...

$$p(\mathbf{x}_n|\mathbf{z}_n,\phi) = \prod_{k=1}^K p(\mathbf{x}_n|\phi_k)^{z_{nk}}$$

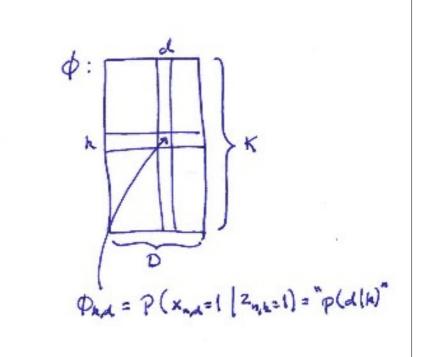

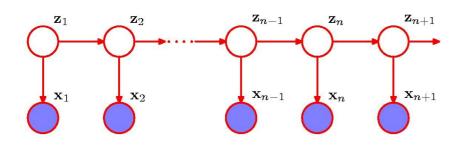

Emission prob

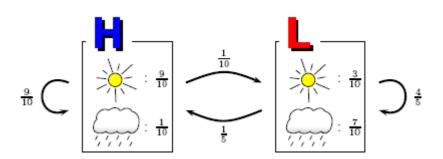

Emission probabilities: The condition observed variables $p(\mathbf{x}_n \mid \mathbf{z}_n)$ from a specific

If the observed values \mathbf{x}_n are discrete (expression) probabilities $\boldsymbol{\phi}$ is a KxD table of probability states specifies the probability of emitting

$$p(\mathbf{x}_n|\mathbf{z}_n,\phi) = \prod_{k=1}^K p(\mathbf{x}_n|\phi_k)^{z_{nk}}$$

HMM joint probability distribution

$$p(\mathbf{X}, \mathbf{Z}|\mathbf{\Theta}) = p(\mathbf{z}_1|\pi) \left[\prod_{n=2}^{N} p(\mathbf{z}_n|\mathbf{z}_{n-1}, \mathbf{A}) \right] \prod_{n=1}^{N} p(\mathbf{x}_n|\mathbf{z}_n, \phi)$$

Observables:

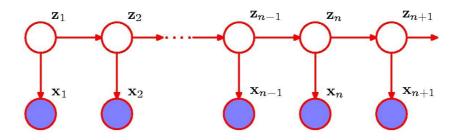

Latent states:

Model parameters:

$$\mathbf{X} = {\mathbf{x}_1, \dots, \mathbf{x}_N}$$
 $\mathbf{Z} = {\mathbf{z}_1, \dots, \mathbf{z}_N}$ $\Theta = {\pi, \mathbf{A}, \phi}$

$$\mathbf{Z} = \{\mathbf{z}_1, \dots, \mathbf{z}_N\}$$

$$\Theta = \{\pi, \mathbf{A}, \phi\}$$

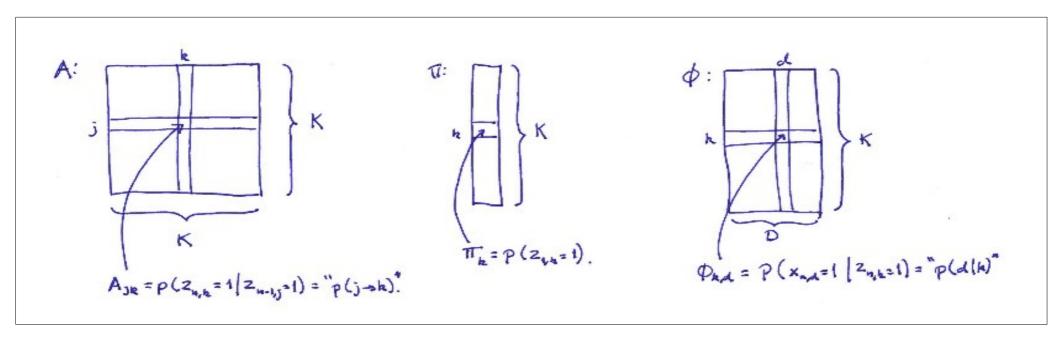

If A and ϕ are the same for all n then the HMM is homogeneous

ML E2022 / CNSP 19/39

HMM joint probability distribution

$$p(\mathbf{X}, \mathbf{Z}|\mathbf{\Theta}) = p(\mathbf{z}_1|\pi) \left[\prod_{n=2}^{N} p(\mathbf{z}_n|\mathbf{z}_{n-1}, \mathbf{A}) \right] \prod_{n=1}^{N} p(\mathbf{x}_n|\mathbf{z}_n, \phi)$$

If A and ϕ are the same for all *n* then the HMM is *homogeneous*

Example – 2-state HMM

Smallest normalized number	2-126	2-1022
Largest normalized number	approx. 2.128	approx. 2 ¹⁰²⁴
Decimal range	approx. 10 ⁻³⁸ to 10 ³⁸	approx. 10 ⁻³⁰⁸ to 10 ³⁰⁰
Smallest denormalized number	approx. 100-45	approx. 10 ⁻³²⁴

Figure B-5. Characteristics of IEEE filoating-point numbers.

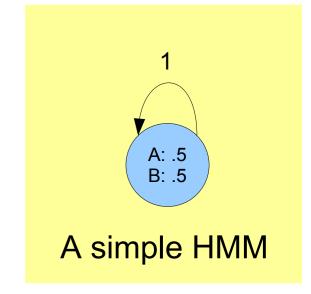

See e.g. Appendix B in Tanenbaum's Structured Computer Organization for further details.

The problem – Too small numbers

For the simple HMM, the joint-probability p(X,Z) is

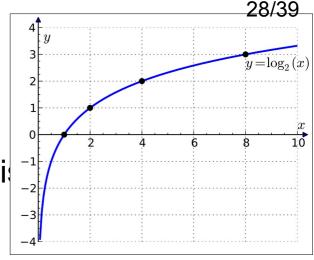

$$p(\mathbf{X}, \mathbf{Z}) = 1 \cdot \prod_{n=2}^{N} 1 \cdot \prod_{n=1}^{N} \frac{1}{2} = \left(\frac{1}{2}\right)^{N} = 2^{-N}$$

If N > 467 then 2^{-N} is smaller than 10^{-324} , i.e. cannot be represented

The problem - Too small

For the simple HMM, the joint-probability $p(\mathbf{X},\mathbf{Z})$ is

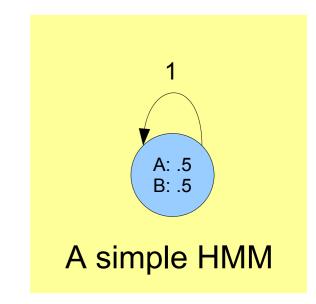

$$p(\mathbf{X}, \mathbf{Z}) = 1 \cdot \prod_{n=2}^{N} 1 \cdot \prod_{n=1}^{N} \frac{1}{2} = \left(\frac{1}{2}\right)^{N} = 2^{-N}$$

If N > 467 then 2^{-N} is smaller than 10^{-324} , i.e. cannot be represented

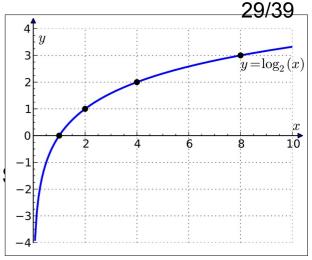

Does this mean that we cannot compute $p(\mathbf{X}, \mathbf{Z})$ for slightly long sequences?

No, we use log-transform. Instead of computing p(X,Z), we compute log p(X,Z)

The problem - Too small

For the simple HMM, the joint-probability $p(\mathbf{X},\mathbf{Z})$ is

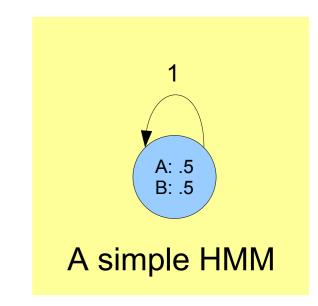

$$p(\mathbf{X}, \mathbf{Z}) = 1 \cdot \prod_{n=2}^{N} 1 \cdot \prod_{n=1}^{N} \frac{1}{2} = \left(\frac{1}{2}\right)^{N} = 2^{-N}$$

If N > 467 then 2^{-N} is smaller than 10^{-324} , i.e. cannot be represented

No problem representing

$$\log p(\mathbf{X}, \mathbf{Z}) = -N$$

as the decimal range is approx -10³⁰⁸ to 10³⁰⁸

Solution: Compute log P(X,Z)

$$p(\mathbf{X}, \mathbf{Z}|\mathbf{\Theta}) = p(\mathbf{z}_1|\pi) \left[\prod_{n=2}^{N} p(\mathbf{z}_n|\mathbf{z}_{n-1}, \mathbf{A}) \right] \prod_{n=1}^{N} p(\mathbf{x}_n|\mathbf{z}_n, \phi)$$

Use log(XY) = log X + log Y, and define log 0 to be -inf

$$\log p(\mathbf{X}, \mathbf{Z}|\mathbf{\Theta}) = \log p(\mathbf{z}_1|\pi) + \sum_{n=2}^{N} \log p(\mathbf{z}_n|\mathbf{z}_{n-1}, \mathbf{A}) + \sum_{n=1}^{N} \log p(\mathbf{x}_n|\mathbf{z}_n, \phi)$$

ML E2022 / CNSP 31/39

Solution: Compute log P(X,Z)

$$\log p(\mathbf{X}, \mathbf{Z}|\mathbf{\Theta}) = \log p(\mathbf{z}_1|\pi) + \sum_{n=2}^{N} \log p(\mathbf{z}_n|\mathbf{z}_{n-1}, \mathbf{A}) + \sum_{n=1}^{N} \log p(\mathbf{x}_n|\mathbf{z}_n, \phi)$$

```
def log_joint_prob(self, x, z):
    """

    Returns the log transformed joint probability of x and z
    """
    logp = log(init_prob[z[0]]) + log(emit_prob[z[0]][x[0]])
    for i in range(1, len(x)):
        logp = logp + log(trans_prob[z[i-1]][z[i]]) + log(emit_prob[z[i]][x[i]])
    return logp
```

32/39

Solution: Compute log P(X,Z)

$$\log p(\mathbf{X}, \mathbf{Z}|\mathbf{\Theta}) = \log p(\mathbf{z}_1|\pi) + \sum_{n=2}^{N} \log p(\mathbf{z}_n|\mathbf{z}_{n-1}, \mathbf{A}) + \sum_{n=1}^{N} \log p(\mathbf{x}_n|\mathbf{z}_n, \phi)$$

```

            > seq600
            log p(x,z) = -842.0056730984585
```

ML E2022 / CNSP 33/39

Using HMMs

- Determine the likelihood of a sequence of observations.
- Find a plausible underlying explanation (or decoding) of a sequence of observations.

ML E2022 / CNSP 34/39

Using HMMs

- Determine the likelihood of a sequence of observations.
- Find a plausible underlying explanation (or decoding) of a sequence of observations.

$$p(\mathbf{X}|\mathbf{\Theta}) = \sum_{\mathbf{Z}} p(\mathbf{X}, \mathbf{Z}|\mathbf{\Theta})$$

ML E2022 / CNSP 35/39

Using HMMs

- Determine the likelihood of a sequence of observations.
- Find a plausible underlying explanation (or decoding) of a sequence of observations.

$$p(\mathbf{X}|\mathbf{\Theta}) = \sum_{\mathbf{Z}} p(\mathbf{X}, \mathbf{Z}|\mathbf{\Theta})$$

The sum has K^N terms, but it turns out that it can be computed in $O(K^2N)$ time, but first we will consider **decoding**

ML E2022 / CNSP 36/39

Decoding using HMMs

Given a HMM Θ and a sequence of observations $\mathbf{X} = \mathbf{x}_1, ..., \mathbf{x}_N$, find a plausible explanation, i.e. a sequence $\mathbf{Z}^* = \mathbf{z}^*_1, ..., \mathbf{z}^*_N$ of values of the hidden variable.

ML E2022 / CNSP 37/39

Decoding using HMMs

Given a HMM Θ and a sequence of observations $\mathbf{X} = \mathbf{x}_1, ..., \mathbf{x}_N$, find a plausible explanation, i.e. a sequence $\mathbf{Z}^* = \mathbf{z}^*_1, ..., \mathbf{z}^*_N$ of values of the hidden variable.

Viterbi decoding

Z* is the overall most likely explanation of **X**:

$$\mathbf{Z}^* = \arg\max_{\mathbf{Z}} p(\mathbf{X}, \mathbf{Z} | \mathbf{\Theta})$$

ML E2022 / CNSP 38/39

Decoding using HMMs

Given a HMM Θ and a sequence of observations $\mathbf{X} = \mathbf{x}_1, ..., \mathbf{x}_N$, find a plausible explanation, i.e. a sequence $\mathbf{Z}^* = \mathbf{z}^*_1, ..., \mathbf{z}^*_N$ of values of the hidden variable.

Viterbi decoding

Z* is the overall most likely explanation of **X**:

$$\mathbf{Z}^* = \arg\max_{\mathbf{Z}} p(\mathbf{X}, \mathbf{Z} | \mathbf{\Theta})$$

Posterior decoding

 \mathbf{z}^*_n is the most likely state to be in the n'th step:

$$\mathbf{z}_n^* = \arg\max_{\mathbf{z}_n} p(\mathbf{z}_n | \mathbf{x}_1, \dots, \mathbf{x}_N)$$

ML E2022 / CNSP 39/39

Summary

- Terminology of hidden Markov models (HMMs)
- Viterbi- and Posterior decoding for finding a plausible underlying explanation (sequence of hidden states) of a sequence of observation
- Next: Algorithms for computing the Viterbi and Posterior decodings efficiently
